The Rat Brain in Stereotaxic Coordinates - The New Coronal Set George Paxinos

The preceding editions made *The Rat Brain in Stereotaxic Coordinates* the second most cited book in science. This Fifth Edition is the result of years of research providing the user with the drawings of the completely new set of coronal sections, now from one rat, and with significantly improved resolution by adding a third additional section level as compared to earlier editions. Numerous new nuclei and structures also have been identified. The drawings are presented in two color, providing a much better contrast for use.

The Fifth Edition continues the legacy of this major neuroscience publication and is a guide for all students and scientists who study the rat brain.

- 161 coronal diagrams based on a single brain.
- Delineations drawn entirely new from a new set of sections.
- Diagrams spaced at constant 120 μm intervals resulting in the high resolution and convenience of use.
- Drawings use blue color lines and black labels to facilitate extraction of information.
- The stereotaxic grid was derived using the same techniques that produced the widely praised stereotaxic grid of the previous editions.
- Over 1000 structures identified, a number for the first time in this edition.
